Era

- ☐ 1. Before 2000
- ☐ 2. 2000-2009
- ☐ 3. 2010-2019
- ☐ 4. 2020-2023

- **Song Count (951):** the number of unique songs analysed after data cleaning.
- **Total Streams (489bn):** the combined Spotify streams of all songs in the dataset.
- **Average Streams (514.22M):** the mean streams per song. This is well above the median (approximately [290M]), which shows that a small number of highly successful songs pull the average upward.
- **Top 10 chart:** *Blinding Lights* is the most-streamed song at roughly [3.7bn] streams, followed by *Shape of You* at [3.6bn]. The remaining songs in the top 10 sit in a narrow band of about [2.6bn to 2.9bn], showing that streaming success is concentrated in a small group of tracks.
- **Era filter:** the slicer lets the user filter every visual by release period (Before 2000, 2000–2009, 2010–2019, 2020–2023).

Song Count and Sum of Released Year

Avg Acousticness by Era

Song Count and Sum of Released Month

- **Acousticness by era:** songs released before 2000 have the highest average acousticness (about 37), followed by 2010–2019 (about 29) and 2020–2023 (about 26). Songs from 2000–2009 have the lowest (about 14). Recent songs are therefore less acoustic than older ones, though the change is not a steady decline.
- **Dataset coverage:** the dataset contains 951 songs, and the totals shown for release year and release month are cumulative sums across all songs, so they do not by themselves show a trend.
- **Takeaway:** the clearest temporal shift in the dataset is towards less acoustic, more produced-sounding music in recent eras, compared with pre-2000 songs.

Song Count and Sum of Chart Presence Count

Avg Streams and Sum of Chart Presence Count

Share of Songs % by Tempo Band

Sum of Total Playlists and Sum of Streams

0.28

On All 4 Platforms %

- **Presence on all platforms:** about 28% of songs appear on the charts of all four platforms (Spotify, Apple, Deezer and Shazam), so most songs chart on some but not all platforms.
- **Average chart presence:** the 951 songs have a total chart presence of about 2.35K, which means a typical song appears on about 2.5 of the 4 platforms.
- **Average streams:** the average is about 0.5bn streams per song, consistent with the 514M average on the overview page.
- **Playlist totals:** the dataset holds about 5.4M playlist placements in total, alongside about 489bn streams, showing how large the playlist footprint is behind the streaming numbers.
- **Tempo distribution:** medium-tempo songs (90–119 BPM) make up the largest share (about 35%), followed by fast (140+, about 28%) and upbeat (120–139, about 26%), while slow songs (<90) are the smallest group at about 10%.
- **Takeaway:** popular songs tend to be mid-to-fast in tempo, and broad cross-platform presence is common but not universal.

Music Analysis

- **Average audio profile:** the bar chart shows danceability (66.98) as the highest average, followed by energy, then valence, with acousticness lowest (27.11). Popular songs are therefore danceable and energetic, and mostly non-acoustic.
- **Mood map:** songs spread across the valence–energy space with no single tight cluster, so popular songs come in a wide range of moods.
- **Tempo and mood:** the stacked chart shows the mood mix in each tempo band (Medium, Fast, Upbeat, Slow). The mood shares look broadly similar across bands, so tempo does not strongly determine mood.
- **Correlation with streams:** danceability (-0.11) and energy (-0.03) are weakly related to streams, so audio features alone do not explain popularity. Spotify (0.79), Apple (0.77) and Deezer (0.60) playlist counts are much more strongly related.

Platform Comparison

- **Average playlist inclusion per song:** Spotify averages about 5.20K playlists per song, Apple about 67.75, and Deezer well below Spotify. Spotify dominates the chart because playlist counts are counted on different scales across platforms.
- **Supporting averages:** average acousticness is 27.11 and average danceability is 66.98, consistent with the audio profile on the previous page.
- **Song-level table:** lists each song's artist(s), artist type, era and mood, showing the mix of solo and collaborative songs, and songs from different eras.
- **Takeaway:** Spotify has by far the largest playlist counts, and playlist presence on all three platforms is positively related to streams.

Artist Impact

- **Average streams by artist type:** Solo songs have the highest average streams (about 0.57bn), followed by Duo (about 0.46bn) and Group (3+) (about 0.35bn). Streams fall as more artists are involved.
- **Top artists by total streams:** The Weeknd leads (about 21bn), followed by Bad Bunny, Ed Sheeran, Taylor Swift, Harry Styles, Eminem, Justin Bieber, Drake and Imagine Dragons.
- **Danceability and energy:** the average danceability and energy values are close in size, with danceability slightly higher.
- **Correlation cards:** Apple playlists (0.77) show a strong relationship with streams, and danceability (−0.11) a weak one.
- **Takeaway:** collaborating does not automatically increase streams, and a handful of artists account for a large share of total streams.
